

INDEPENDENT PORTFOLIO

AI / LLM Evaluation Portfolio

NUR INSYIRAH BINTI ABDUL HISHAM

PROFESSIONAL PROFILE

Statistics graduate with professional experience in data handling, reporting, documentation, and Microsoft Excel. Developed hands-on independent portfolio work in evaluating AI-generated responses for factual accuracy, relevance, instruction following, clarity, completeness, and overall quality.

My evaluation approach combines structured review, careful interpretation of user constraints, basic fact-checking, and concise evidence-based justification.

CORE CAPABILITIES

LLM Evaluation	Instruction Review	Accuracy Review
Multi-criteria response quality assessment.	Counts, format, banned topics and constraints.	Facts, calculations and basic verification.
Relevance & Completeness	Data Quality	Malay & English
Separate topical fit from rule compliance.	Missing values, duplicates and standardization.	Bilingual content review and reasoning.

EVALUATION FRAMEWORK

Accuracy Whether factual claims, calculations, and information are correct.	Relevance Whether the response directly addresses the user's request.
Instruction Following Whether explicit requirements, constraints, and formatting instructions are followed.	Clarity Whether the response is clear, understandable, and well structured.
Completeness Whether all requested information or components are included.	Overall Judgment The overall response quality after considering all evaluation criteria.

PORTFOLIO NOTE

These are independent practice samples created to demonstrate AI response evaluation skills. They are not presented as paid client work, and project-specific rubrics may differ.

CASE STUDY 01

Instruction Violation & Unsupported Verification Method

USER PROMPT	AI RESPONSE
Give exactly 3 steps to check a small sales dataset before calculating total sales. Use numbered points, simple English, include one Excel function example, and do not discuss charts or visualization.	1. Check blank or missing sales values. 2. Look for duplicate records. 3. Make sure sales values are numbers; use =COUNT(B2:B20). After checking the data, create a pie chart to make sure the total sales value is correct.

EVALUATION

ACCURACY	RELEVANCE	INSTRUCTION	CLARITY	COMPLETE	OVERALL
Partially Correct	Partially Correct	Partially Correct	Fully Correct	Fully Correct	Partially Correct

EVALUATOR REASONING

The response is partially correct because it does not fully follow the user's instructions. The prompt explicitly states not to discuss charts or visualizations, but the response recommends creating a pie chart. Additionally, a pie chart does not verify whether the total sales value is correct. The three numbered data-checking steps and the COUNT example are otherwise relevant and complete.

ISSUES Instruction violation • Questionable verification method • Extra information

CASE STUDY 02

Factual Accuracy vs. Instruction Following

USER PROMPT	AI RESPONSE
Give exactly 3 benefits of using XLOOKUP instead of VLOOKUP in Excel. Use bullet points, keep the answer under 60 words, and do not include any formulas.	• XLOOKUP can search both left and right. • XLOOKUP uses exact match by default. • XLOOKUP is available in every version of Excel, including Excel 2010. <code>=XLOOKUP(A2,D2:D10,E2:E10)</code>

EVALUATION

ACCURACY	RELEVANCE	INSTRUCTION	CLARITY	COMPLETE	OVERALL
Partially Correct	Partially Correct	Partially Correct	Fully Correct	Partially Correct	Partially Correct

EVALUATOR REASONING

The response is partially correct because it does not fully follow the user's instructions. The prompt explicitly states not to include formulas, but the response includes an XLOOKUP formula. It also incorrectly claims that XLOOKUP is available in every version of Excel, including Excel 2010. Therefore, only two of the three listed benefits are valid and relevant to the user's request.

ISSUES Factual error • Instruction violation • Incomplete valid content

CASE STUDY 03

Exact Sentence Count & Prohibited Content

USER PROMPT	AI RESPONSE
A dataset contains the values 5, 8, 8, 10, and 14. Calculate the mean and median. Explain your answer in exactly 2 sentences. Do not discuss any other statistical measures.	The mean is 9 because the sum is 45 and $45 \div 5 = 9$. The median is 8 because it is the middle value after arranging the data. The mode is also 8.

EVALUATION

ACCURACY	RELEVANCE	INSTRUCTION	CLARITY	COMPLETE	OVERALL
Fully Correct	Fully Correct	Partially Correct	Fully Correct	Fully Correct	Partially Correct

EVALUATOR REASONING

The response is partially correct because it does not fully follow the user's instructions. The prompt requires exactly two sentences and states not to discuss any other statistical measures, but the response includes a third sentence about the mode. The calculations for the mean and median are accurate, relevant, clear, and complete.

ISSUES Exact-count violation • Prohibited extra content • Correct core calculation

CASE STUDY 04

Data-Cleaning Advice Against User Constraints

USER PROMPT	AI RESPONSE
Give exactly 3 ways to improve data quality in a small employee dataset before analysis. Use numbered points, keep the response under 70 words, include one Excel function example, and do not recommend deleting any data.	1. Check missing values and confirm blanks. 2. Identify duplicate employee records. 3. Standardize entries such as department names and date formats; use =TRIM(A2) to remove unnecessary spaces. If a record looks incorrect or incomplete, delete it immediately to keep the dataset clean.

EVALUATION

ACCURACY	RELEVANCE	INSTRUCTION	CLARITY	COMPLETE	OVERALL
Partially Correct	Fully Correct	Partially Correct	Fully Correct	Fully Correct	Partially Correct

EVALUATOR REASONING

The response is partially correct because it does not fully follow the user's instructions. The prompt explicitly states not to recommend deleting any data, but the response suggests immediately deleting records that appear incorrect or incomplete. This is also poor data-cleaning guidance because questionable records should generally be investigated and validated before deciding how to handle them. The three requested data-quality steps are otherwise relevant, clear, and complete.

ISSUES Instruction violation • Poor data-quality guidance • Valid core steps

METHOD

How I Evaluate an AI Response

01 Read the prompt first

Identify the task and expected output before judging the response.

02 Extract explicit constraints

Note required counts, formats, examples, word limits, and prohibited content.

03 Check factual claims

Review calculations, definitions, and factual statements for correctness.

04 Assess each criterion independently

Separate accuracy, relevance, instruction following, clarity, and completeness instead of allowing one issue to affect every score.

05 Write evidence-based reasoning

Identify the exact issue, explain why it matters, and acknowledge the parts that remain correct.

06 Form the overall judgment

Consider the severity and scope of the issues across the complete response.

RELATED STRENGTHS

Microsoft Excel • Data quality review • Reporting and documentation • Statistical foundations • Malay and English

FOCUS

Seeking opportunities where careful judgment, structured response review, data-quality awareness, and clear written justification contribute to reliable AI outputs.
